

Chatbot Using GoogleDialogflow + Python + MongoDB + Telegram

These individual component have the following purpose:

1. **GoogleDialogflow** -> *Framework to handle natural language processing*
 2. **Python** -> *Framework for web application and to handle logics in webhook fulfilment calls*
 3. **MongoDb** -> *Database for storing user details and conversation.*
 4. **Telegram** -> *Integration platform for the chatbot.(will serve as frontend for users)*
-

The bot created here (covid-19 bot) will serve the following purpose:

1. Greet the user once he starts the conversation.
 2. Asks for some personal details like:
 - Name, email, phone, zip.
 3. Verify the details and do error handling.
 4. Ask for the country name for which user wants to see the covid-19 stats.
 5. Ask some followup question before ending the conversation like seeing the world overview for covid-19
